Local de emissão : Cidade de Maputo
Data de emissão : 23/06/2013

This project was developed to support a contest proposal for the Mozambican National Bank. The proposal aimed to collect and create a comprehensive database containing information on every Mozambican citizen. Once stored, this data could be accessed via an API, allowing systems across the country to better manage debt

collection and taxation. Our group advanced to the final stage of the contest, and there is optimism that this proposal will either be sold to or funded by the government. The webpage was developed with the use of React Js and Typescript.

2.2. World Countries

Personal project developed using React JS, leveraging a public API for country data. This project was created to provide visual aids to assist my niece in learning about the diverse countries of the world for her geography class.
